

Process Scheduler

Operating System Process Scheduling Simulator

Overview

Process Scheduler is an educational operating system simulation that visualizes CPU scheduling algorithms and process execution, helping users understand how operating systems manage tasks.

Problem

Scheduling algorithms are often difficult for students to understand through theory alone due to limited visual representation.

Solution

Built an interactive simulator that demonstrates process execution order, waiting times, turnaround times, Gantt charts, and scheduling performance using multiple algorithms.

My Role

- UI Design
- Frontend Development
- Algorithm Visualization
- Performance Analysis

Technologies

HTML • CSS • Bootstrap • JavaScript

Outcome

An interactive educational tool that simplifies operating system concepts through real-time scheduling visualization and performance metrics.
